

ChickSafe

ChickSafe Eco and Advance Automatic Chicken Coop door openers

**Convenience and
peace of mind for
chicken keepers**

Brinsea's ChickSafe coop door openers are the rugged, reliable, fuss-free solution to the problem of being away from home when your chickens need their coop door closing at night or opening in the morning.

Chicken keepers need complete confidence in any coop door opener – otherwise the birds are at serious risk from predators – so Brinsea's ChickSafe models feature a unique (patent pending) mechanism that means there is only one moving part and no mechanical switches for ultimate reliability. The ChickSafe units both feature 'auto-stop' if a chicken is obstructing the door.

The ChickSafe models are easily fixed to most chicken coops with two screws (supplied) (see <https://www.brinsea.com/c-100-chicken-coop-door-openers.aspx> for more information) and require no setup or calibration. Just attach the cord to the sliding door and the ChickSafe goes through an automatic procedure to detect the door position and it's ready to go!

Every part of the ChickSafe coop door openers are designed with long life and weather resistance which means Brinsea is confident in providing a free **3-year warranty** subject to online registration.

ChickSafe

ChickSafe Eco and Advance Automatic Chicken Coop door openers

Brinsea Chicksafe models can lift doors between 11 oz and 9 lbs and can operate in temperatures from -4°F to 122°F. Both ChickSafe models are powered by 4 x AA batteries (supplied).

The **ChickSafe Eco** is triggered to either open or close your coop door based on rising or falling light levels. As the sun comes up, the increasing light levels trigger the ChickSafe Eco to open the coop door and the falling light levels at dusk which stimulate chickens to go inside the coop, trigger the device to close the chicken coop door.

The only adjustment on the Eco is for the sensitivity to light level at closing – ensuring you can adjust the setting to allow the slowest hen to get to bed. No other user adjustment is necessary – just fit and forget. The Eco has a light indicator to show the following: the door is open or closed, the door is jammed or if the batteries need replacing. The software is not triggered by quick changes in light level so that passing car headlights won't cause the door to open at night, for example.

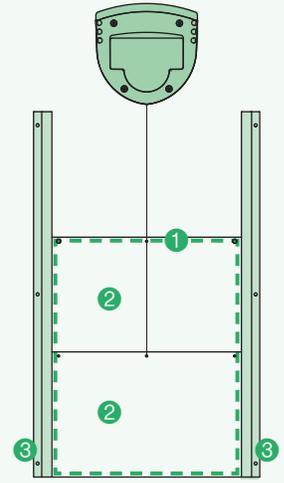

The **ChickSafe Advance** has the same features as the Eco but with the addition of a timing system which allows the user to set the door to open and close based on changing light levels or time of day. It's also possible to program the system to be triggered by lowering light levels as well as a 'latest time to close' time setting.

The digital control system also allows the user to override the automatic system and immediately either open or close the door or to hold the door in its current position until the override is switched off – handy if trying to isolate birds in the coop. The control also allows the user to delay the opening of the door in the morning on 2 days out of 7 to a selected time which can be used to keep the birds contained at weekends, for example.

The ChickSafe door

To complement the ChickSafe Automatic coop door openers, Brinsea have developed an innovative, space-saving 2-stage sliding coop door to replace an existing sliding or hinged coop door. The ChickSafe door is aluminium with uPVC runners for long-life and fits to your wooden chicken coop with 6 screws (supplied).

- 1 Maximum pophole size approx. 13in high x 11in wide
- 2 Two aluminium door panels: 11.8in x 7.3in x 0.08in thick
- 3 Black uPVC channels
